

Universally compatible Payment API that connects e-business software with Credit Card Processing

DevConnect acts as a bridge between the merchant's website and the financial institutions that process payment transactions. Payment data is collected online from the consumer and submitted to the gateway for real-time authorization.

DevConnect Overview

Payment gateways facilitate electronic commerce by enabling merchants to accept credit cards as methods of payment for goods and services sold online. DevConnect acts as a bridge between the merchant's website and the financial institutions that process payment transactions. Payment data is collected online from the consumer and submitted to the gateway for real-time authorization.

DevConnect is the recommended integration method for merchants who have the capability to initiate both client and server side SSL connections. This method offers the merchant a high degree of security and control because transaction data is submitted to the gateway over a secure server-to-server connection that is initiated by the merchant server. Since the merchant server will receive a response directly from the gateway, the merchant has more control over the response to the end customer.

Available Solutions

DevConnect APIs support multiple development languages and platforms, including:

- Programming Languages: C#, J#, ASP.NET, VB.NET, ASP, Delphi, Perl, PHP, Visual Basic, C/C++, Java, Cold Fusion, and Miva.
- Platforms: Windows, UNIX, AS400, IBM AIX
